

Swedish Standards corresponding to documents referred to in this Standard are listed in “Catalogue of Swedish Standards”, annually issued by SIS. The Catalogue lists, with reference number and year of Swedish approval, International and European Standards approved as Swedish Standards as well as other Swedish Standards.

Transportörer - Transportband med stålkord - Dragprovning i längdriktningen - Del 1: Mätning av töjning (ISO 7622-1:1984)

Motsvarigheten och aktualiteten i svensk standard till de publikationer som omnämns i denna standard framgår av “Katalog över svensk standard”, som årligen ges ut av SIS. I katalogen redovisas internationella och europeiska standarder som fastställts som svenska standarder och övriga gällande svenska standarder.
English version

Steel cord conveyor belts – Longitudinal traction test - Part 1: Measurement of elongation

(ISO 7622-1:1984)

This European Standard was approved by CEN on 1995-01-14. CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

The European Standards exist in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Foreword

The text of the International Standard from ISO/TC 41 “Pulleys and belts (including veebelts)” of the International Organization for Standardization (ISO) has been taken over as a European Standard by the Technical Committee CEN/TC 188 “Cord conveyor belts”.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by April 1996, and conflicting national standards shall be withdrawn at the latest by April 1996.

This European Standard has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EC Directive(s).

According to the CEN/CENELEC Internal Regulations, the following countries are bound to implement this European Standard: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom.

Endorsement notice

The text of the International Standard ISO 7622-1:1984 has been approved by CEN as a European Standard without any modification.
Steel cord conveyor belts – Longitudinal traction test – Part 1: Measurement of elongation

0 Introduction

The test method described in this part of ISO 7622 is intended to verify, by destructive testing, the elongation properties of steel cords constituting the carcass of conveyor belts. As it is a destructive test, it should be used only in the event of litigation or where no certificate of compliance is issued by the cord manufacturer.

NOTE – Notice should be taken that differences in elongation can occur between raw steel cords and rubber-coated steel cords. For this reason the values determined in accordance with this method and the values stated in a certificate of the cord manufacturer can differ.

1 Scope and field of application

This part of ISO 7622 specifies a method for the determination of the elongation of steel cords constituting the carcass of conveyor belts, when subjected to a force corresponding to 10 % and to 60 % of the specified tensile strength.

It applies exclusively to conveyor belts with a steel carcass.

NOTE – A method for the determination of tensile strength is specified in ISO 7622/2.

2 Reference

ISO 471, Rubber – Standard temperatures, humidities and times for the conditioning and testing of test pieces.

3 Principle

Traction test on a steel cord, taken from the carcass of the belt. Determination of the elongation, measured using an extensometer, at 10 % and 60 % of the specified tensile strength, using for example a dynamometer the rate of separation of the jaws of which is specified and maintained constant.

4 Apparatus

4.1 Dynamometric tensile testing machine, complying with the following requirements:

a) the force exerted by the machine shall be adaptable to the strength of the test specimen;

b) the rate of separation of the jaws shall be capable of being set at 25 ± 5 mm/min and shall be capable of being maintained constant;

c) the separation between the jaws shall be capable of being set at at least 250 mm.

4.2 Device for holding the test specimen cord, such that it is impossible for the test specimen to slip during the test.

Two fixed grooved pulleys of diameter at least either 50 mm or ten times the cord diameter, d (see the figure); constituting the upper and lower holding device, can be used, for example.

Figure – Device for holding the test specimen cord

4.3 Extensometer, accurate to at least 0.01 %.

As the elongation of steel cords is generally very low, accurate, but sensitive, extensometers, which could be damaged if the test specimen should break, have to be used. For this reason, the measurement is limited to 60 % of the specified tensile strength.
4.4 Device for recording the curve of traction force as a function of elongation, if available.

5 Test specimens

Prepare four test specimens (two S-twist and two Z-twist) as follows:

- take a sample at least 400 mm long from the belt;
- using a knife, cut the compound between the layer of cords and the remainder of the belt;
- then cut the compound so as to isolate the cords from the central part and extract four cords, taking care not to subject them to any tensile stress;
- strip the rubber coating from the whole cord length or at least from the area at the end of each of these cords that is to be placed in the holding device.

6 Procedure

Carry out four tests at least five days after manufacture of the belt.

Unless otherwise specified, in which case note this fact in the test report, carry out the tests at 23 ± 2 °C and at 50 ± 5 % relative humidity.

Place the ends of the cord on the holding device, as follows:

- fix one end on the upper device;
- fix the other end on the lower device, and apply an initial tractive force equal to 50 times the linear density (mass per metre) of the cord (this is to define the zero point of the registration curve clearly);
- position the two jaws of the extensometer with a separation of between 100 and 300 mm.

Start the dynamometer, with the rate of separation of the jaws maintained constant at 25 ± 5 mm/min.

Record and note the elongations at 10 % and at 60 % of the specified minimum tensile strength of the belt in relation to the number of cords.

7 Expression of results

Express the elongation as a percentage of the initial length.

Take as the result the arithmetic mean value of the four measurements made at 10 % and at 60 % of the specified minimum tensile strength.

Express the result to the nearest 0.1 %.

8 Test report

The test report shall contain the following information:

a) reference to this part of ISO 7622;
b) the mean values of elongation at 10 % and at 60 % of the specified minimum tensile strength, in accordance with clause 7;
c) any operating details not specified in this part of ISO 7622, or regarded as optional, together with any incidents likely to have influenced the results.
