Markundersökningar – Bestämning av utbytesaciditet i bariumkloridextrakt

Soil quality – Determination of exchangeable acidity in barium chloride extracts

I standarden beskrivs en metod för bestämning av utbytesaciditeten ur bariumkloridextrakt från jordprover som tagits fram i enlighet med SS-ISO 11260, Markundersökningar – Bestämning av effektiva katjonbyteskapaciteten och basmättnadsgraden med användning av bariumkloridlösning. Standarden kan användas för alla typer av lufttorkade jordprover som har förbehandlats enligt SS-ISO 11464, Markundersökningar – Förbehandling av jordprov för fysikalisk och kemisk analys.

I SIS "Katalog över svensk standard" framgår vilka av de publikationer som omnämns i denna standard som har fastställts som svensk standard och som har översatts till svenska.

This Swedish standard consists of the English version of ISO 14254:2001 (E), Soil quality – Determination of exchangeable acidity in barium chloride extracts.

This standard specifies a method for determination of exchangeable acidity in barium chloride extracts of soil samples obtained according to ISO 11260, Soil quality – Determination of effective cation exchange capacity and base saturation using barium chloride solution. This International standard is applicable to all types of air-dry samples which have been pre-treated in accordance with ISO 11464, Soil quality – Pre-treatment of samples for physico-chemical analysis.

Swedish standards corresponding to documents referred to in this Standard are listed in "Catalogue of Swedish Standards" issued by SIS.

Dokumentet består av 8 sidor.

Upplysningar om sakinnhålet i standarden lämnas av SIS, Swedish Standards Institute, tel 08 - 555 520 00.

Standarder kan beställas hos SIS Förlag AB som även lämnar allmänna upplysningar om svensk och utländsk standard.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

International Standard ISO 14254 was prepared by Technical Committee ISO/TC 190, Soil quality, Subcommittee SC 3, Chemical methods and soil characteristics.
Soil quality — Determination of exchangeable acidity in barium chloride extracts

1 Scope

This International Standard specifies a method for the determination of exchangeable acidity in barium chloride extracts of soil samples obtained according to ISO 11260.

The procedure described herein mainly concerns the determination of total exchangeable acidity by means of a fixed-pH end-point titration (see note). Two optional procedures are also given, describing respectively, determinations of free H⁺ acidity and of aluminium in the extracts.

This International Standard is applicable to all types of air-dry soil samples which have been pretreated in accordance with ISO 11464.

NOTE Titration of exchangeable acidity by means of a fixed-pH end-point may not be specific to a given acid species. The end-point pH value retained is 7,8, corresponding to complete precipitation of Al³⁺ ions in synthetic solutions. Titration of soil extracts to this pH may also include some more weakly ionized species or weak acid organic compounds.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this International Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO 3696, Water for analytical laboratory use — Specification and test methods

ISO 11260, Soil quality — Determination of effective cation exchange capacity and base saturation level using barium chloride solution

ISO 11464, Soil quality — Pretreatment of samples for physico-chemical analyses

ISO 11465, Soil quality — Determination of dry matter and water content on a mass basis — Gravimetric method

3 Principle

The soil sample is extracted in accordance with ISO 11260. The 0,1 mol · l⁻¹ extract is titrated with a 0,05 mol · l⁻¹ NaOH solution up to pH = 7,8. The use of phenolphthalein as indicator is allowed, but shall be specified in the test report.

An alternative method for determination of the free H⁺ acidity is proposed, in which sodium fluoride is added to the soil extract before the titration (BaF₂ precipitates but an excess of NaF is not necessary). Aluminium ions are complexed and only the H⁺ acidity is detected during the titration process.

Two other optional methods for the determination of aluminium are proposed, using respectively flame atomic absorption spectrometry and inductively coupled plasma emission spectrometry.
4 Reagents

Use only reagents of recognized analytical grade and distilled or deionized water for all solutions which shall be stowed in suitable plastics bottles.

4.1 Water having an electrical conductivity not higher than 0,2 mS·m⁻¹ at 25 °C (grade 2 water in accordance with ISO 3696).

4.2 Disodium tetraborate decahydrate (borax), \( \text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O} \) (molecular mass = 381,5) of a purity > 99,5 %, which should be stored in a tightly closed bottle.

4.3 Buffer solutions for pH-meter calibration.

4.3.1 Buffer solution pH = 4,00 (20 °C): Dissolve 10,21 g ± 0,01 g of potassium hydrogen phthalate, \( \text{C}_8\text{H}_5\text{KO}_4 \), in water (4.1) and dilute to 1 000 ml.

4.3.2 Buffer solution pH = 7,00 (20 °C): Dissolve 3,800 g ± 0,005 g of potassium dihydrogen phosphate, \( \text{KH}_2\text{PO}_4 \), and 3,415 g ± 0,005 g of disodium hydrogen phosphate, \( \text{Na}_2\text{HPO}_4 \), in water (4.1) and dilute to 1 000 ml.

4.3.3 Buffer solution pH = 9,22 (20 °C): Dissolve 3,800 g ± 0,005 g of disodium tetraborate decahydrate, \( \text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O} \), in water (4.1) and dilute to 1 000 ml.

Commercial buffer solutions can be used in accordance with the manufacturer’s instructions.

4.4 Indicators (optional)

4.4.1 Methyl orange (colour change between pH = 3,0 and pH = 4,4): 0,100 g ± 0,005 g in 100 ml of water.

4.4.2 Methyl red (colour change between pH = 4,2 and pH = 6,2): 0,200 g ± 0,005 g in 100 ml of ethanol.

4.4.3 Phenolphthalein (colour change between pH = 8,2 and pH = 10,00): 1,00 g ± 0,01 g in 100 ml of ethanol.

4.5 Hydrochloric acid, \( c(\text{HCl}) = 1 \text{ mol} \cdot \text{l}^{-1} \)

Dilute 83 ml of concentrated hydrochloric acid (\( d = 1,19 \text{ g} \cdot \text{ml}^{-1} \sim 12 \text{ mol} \cdot \text{l}^{-1} \)) with water to 1 000 ml. This solution shall be standardized by means of borax (4.2) following the reaction:

\[
5 \text{H}_2\text{O} + \text{B}_4\text{O}_7^{2-} + 2\text{H}^+ \rightarrow 4 \text{H}_3\text{BO}_3
\]

A mass of borax of about 1,928 g dissolved in about 100 ml of water (4.1) (heat slightly to accelerate dissolution) will need 10 ml of a solution of hydrochloric acid containing exactly 1 mol · l⁻¹ to be neutralized.

An end-point at pH = 5 shall be considered, or methyl red used as indicator. The concentration of this solution shall be tested at least every month.

A commercial standard solution can be used in accordance with the manufacturer’s instructions.

4.6 Sodium hydroxide solution, \( c(\text{NaOH}) = (1,000 ± 0,025) \text{ mol} \cdot \text{l}^{-1} \)

Dissolve 40,0 g ± 0,5 g of carbonate-free sodium hydroxide in water (4.1) and dilute to 1 000 ml. This solution shall be standardized by titration with the hydrochloric acid solution (4.5) (end point: pH = 3,5 or methyl orange as indicator).

Its concentration shall be tested at least every week and shall be within the range 0,975 mol · l⁻¹ to 1,025 mol · l⁻¹.

With time, this solution can absorb carbon dioxide from the atmosphere. The presence of carbonate can be detected by carrying out another titration as described above but down to pH = 8,5 instead of pH = 3,5 (or phenolphthalein as indicator instead of methyl orange). When a difference of volume is observed between the two end-points, then a new solution (4.6) shall be prepared.
