Foreword

This document (EN ISO 14906:2004) has been prepared by Technical Committee CEN/TC 278 "Road Transport and Traffic Telematics (RTTT)", the secretariat of which is held by NEN, in collaboration with Technical Committee ISO/TC 204 “Intelligent Transport Systems (ITS)".

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by March 2005, and conflicting national standards shall be withdrawn at the latest by March 2005.

In order to facilitate migration from ENV ISO 14906, equipment procured and installed in accordance with ENV ISO 14906 has been considered when drafting this European Standard. Operation of such equipment and procurement of additional equipment for systems based on such equipment can continue with reference to Directive 93/36/EEG Article 8 item 3c.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.
Introduction

This document specifies an application interface for Electronic Fee Collection (EFC) systems, which are based on the Dedicated Short-Range Communication (DSRC). It supports interoperability between EFC systems on an EFC-DSRC application interface level.

This document provides specifications for the EFC transaction model, EFC data elements (referred to as attributes) and functions, from which an EFC transaction can be built. The EFC transaction model provides a mechanism that allows handling of different versions of EFC transactions and associated contracts. A certain EFC transaction supports a certain set of EFC attributes and EFC functions as defined in this European Standard. It is not envisaged that the complete set of EFC attributes and functions is present in each piece of EFC equipment, be on-board equipment (OBE) or roadside equipment (RSE).

This document provides the basis for agreements between operators, which are needed to achieve interoperability. Based on the tools specified in this document, interoperability can be reached by operators recognising each others EFC transactions (including the exchange of security algorithms and keys) and implementing the EFC transactions in each others RSE, or they may reach an agreement to define a new transaction (and contract) that is common to both. Considerations should also be made by each operator that the RSE has sufficient resources to implement such additional EFC transactions.

In order to achieve interoperability, operators should agree on issues like:

— which optional features are actually being implemented and used;
— access rights and ownership of EFC application data in the OBE;
— security policy (including encryption algorithms and key management, if applicable);
— operational issues, such as how many receipts may be stored for privacy reasons, how many receipts are necessary for operational reasons (e.g. as entry tickets or as proof of payment);
— the agreements needed between operators in order to regulate the handling of different EFC transactions.

This document has the following structure. In the first four clauses the scope, normative references, definitions of terms and abbreviations are accounted for. Next, in Clause 5, the EFC Application interface architecture is described in terms of its relation to the DSRC communication architecture, including the addressing of data attributes and of components. In the following Clause 6, the EFC transaction model is introduced, defining the common steps of each EFC transaction, in particular the initialisation phase. Clauses 7 and 8 are dedicated to the detailed specification of the EFC application functions and of the EFC data attributes, respectively. Four annexes provide:

1. Annex A: the normative ASN.1 specifications of the used data types (EFC action parameters and attributes);
2. Annex B: an informative example of a transaction based on the CARDME specification, including bit-level specification;
3. Annex C: informative examples of EFC transaction types, using the specified EFC functions and attributes;
4. Annex D: an informative listing of functional requirements, which can be satisfied by using the tools provided by this document.
1 Scope

This document specifies the application interface in the context of Electronic Fee Collection (EFC) systems using the Dedicated Short-Range Communication (DSRC).

The EFC application interface is the EFC application process interface to the DSRC Application Layer, as can be seen in Figure 1 below. The scope of this document comprises specifications of:

— EFC attributes (i.e. EFC application information);
— the addressing procedures of EFC attributes and (hardware) components (e.g. ICC and MMI);
— EFC application functions, i.e. further qualification of actions by definitions of the concerned services, assignment of associated ActionType values and content and meaning of action parameters;
— the EFC transaction model, which defines the common elements and steps of any EFC transaction;
— the behaviour of the interface so as to ensure interoperability on an EFC-DSRC application interface level.

Figure 1 — The EFC application interface

This is an interface standard, adhering to the open systems interconnection (OSI) philosophy (ISO/IEC 7498-1), and it is as such not concerned with the implementation choices to be realised at either side of the interface.

This document provides security-specific functionality as place holders (data and functions) to enable the implementation of secure EFC transactions. Yet the specification of the security policy (including specific security algorithms and key management) remains at the discretion and under the control of the EFC operator, and hence is outside the scope of this document.
2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 12834:2003, Road transport and traffic telematics - Dedicated Short Range Communication (DSRC) – DCRC application layer.

ISO 612, Road vehicles - Dimensions of motor vehicles and towed vehicles - Terms and definitions.

ISO 1176, Road vehicles - Masses - Vocabulary and codes.

ISO 3779, Road vehicles - Vehicle identification number (VIN) - Content and structure.

ISO 4217, Codes for the representation of currencies and funds.

\(^1\) Currently being revised.
3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1 access credentials
data that is transferred to on-board equipment (OBE), in order to establish the claimed identity of a roadside equipment (RSE) application process entity

NOTE The access credentials carries information needed to fulfil access conditions in order to perform the operation on the addressed element in the OBE. The access credentials can carry passwords as well as cryptographic based information such as authenticators.

3.2 action
function that an application process resident at the roadside equipment can invoke in order to make the on-board equipment execute a specific operation during the transaction

3.3 attribute
application information formed by one or by a sequence of data elements, and is managed by different actions used for implementation of a transaction

3.4 authenticator
data appended to, or a cryptographic transformation (see 3.8) of, a data unit that allows a recipient of the data unit to prove the source and/or the integrity of the data unit and protect against forgery

3.5 channel
information transfer path

[ISO 7498-2]

3.6 component
logical and physical entity composing an on-board equipment, supporting a specific functionality

3.7 contract
expression of an agreement between two or more parties concerning the use of the road infrastructure

3.8 cryptography
discipline which embodies principles, means, and methods for the transformation of data in order to hide its information content, prevent its undetected modification or/and prevent its unauthorised use

[ISO 7498-2]

3.9 data group
collection of closely related EFC data attributes which together describe a distinct part of an EFC transaction

3.10 data integrity
property that data has not been altered or destroyed in an unauthorised manner

[ISO 7498-2]
3.11 element
in the context of DSRC, a directory containing application information in form of attributes

3.12 on-board equipment
equipment located within the vehicle and supporting the information exchange with the roadside equipment. It is composed of the on-board unit and other sub-units whose presence have to be considered optional for the execution of a transaction

3.13 on-board unit
minimum component of an on-board equipment, whose functionality always includes at least the support of the DSRC interface

3.14 roadside equipment
Equipment located at a fixed position along the road transport network, for the purpose of communication and data exchanges with the on-board equipment of passing vehicles

3.15 service (EFC)
road transport related facility provided by a service provider. Normally a type of infrastructure, the use of which is offered to the user for which the User may be requested to pay

3.16 service primitive (communication)
elementary communication service provided by the Application layer protocol to the application processes

NOTE The invocation of a service primitive by an application process implicitly calls upon and uses services offered by the lower protocol layers.

3.17 service provider (EFC)
operator that accepts the user's payment means and in return provides a road-use service to the user

3.18 session
exchange of information and interaction occurring at a specific EFC station between the roadside equipment and the user/vehicle

3.19 transaction
whole of the exchange of information between the roadside equipment and the on-board equipment necessary for the completion of an EFC operation over the DSRC

3.20 transaction model
functional model describing the general structure of Electronic Payment Fee Collection transactions

3.21 user
entity that uses transport services provided by the Service Provider according to the terms of a contract
4 Abbreviations

For the purpose of this document, the following abbreviations apply throughout the document unless otherwise specified.

4.1 ADU

5 EFC application interface architecture

5.1 Relation to the DSRC communication architecture

The DSRC services are provided to an application process by means of the DSRC Application Layer service primitives, which are abstract implementation interactions between a communication service user and a provider. The services are offered by the DSRC communication entities by means of its DSRC Application Layer (EN 12834 / ISO/DIS 15628).

The Transfer Kernel of DSRC Application Layer offers the following services to application processes (see also Figure 2 above):

- **GET**: The invocation of a GET service request results in retrieval (i.e. reading) of application information (i.e. Attributes) from the peer service user (i.e. the OBE application process), a reply is always expected.

- **SET**: The invocation of a SET service request results in modification (i.e. writing) of application information (i.e. Attributes) of the peer service user (i.e. the OBE application process). This service may be requested in confirmed or non-confirmed mode, a reply is only expected in the former case.

- **ACTION**: The invocation of an ACTION service request results in a performance of an action by the peer service user (i.e. the OBE application process). An action is further qualified by the value of the ActionType. This service may be requested in confirmed or non-confirmed mode, a reply is only expected in the former case.
— EVENT-REPORT: The invocation of an EVENT-REPORT service request forwards a notification of an event to the peer service user.

— INITIALISATION: The invocation of an initialisation service request by RSE results in an attempt to initialise communication between a RSE and each OBE that has not yet established communication with the concerned RSE. The Initialisation service is only used by the Initialisation Kernel as defined in EN 12834 / ISO/DIS 15628.

### 5.2 Usage of DSRC application layer by the EFC application interface

EFC uses the following services offered by DSRC Application Layer (as defined in EN 12834 / ISO/DIS 15628):

— The INITIALISATION services:
  
  — Notify Application RSU (at RSE);
  — End Application (at RSE);
  — Register Application RSU (at RSE);
  — Deregister Application (at RSE and OBE);
  — Notify Application OBU (at OBE);
  — Register Application OBU (at OBE)

  are used to realise the EFC-specific initialisation mechanism (see clause 6);

— The GET service is used to retrieve EFC attributes (For attribute specifications see clause 8);

— The SET service is used to set EFC attributes;

— The ACTION services are applied to realise additional EFC specific functionality needed to support EFC application processes, such as TRANSFER_CHANNEL, SET_MMI and ECHO (see 7.2).

In the following, the EFC-specific usage of the DSRC Layer 7 services is specified in detail.

**NOTE** The EVENT-REPORT-service can be implicitly used by EFC application processes. It is e.g. used indirectly as part of an already defined command to release an application process (see EN 12834 / ISO/DIS 15628, Ready Application). However as the EVENT-REPORT-service is not explicitly used by EFC application processes, this service is not further referred to in this document.

### 5.3 Addressing of EFC attributes

#### 5.3.1 Basic mechanism

EFC Attributes are used to transfer the EFC application-specific information.

EFC Attributes are composed of one or more data elements of specified ASN.1 types. Each data element is associated with, within the context of this document, an unambiguous name.

To each EFC Attribute, an AttributeID is associated. The AttributeID enables to unambiguously identify and address an EFC Attribute.
EXAMPLE Figure 3 illustrates the basic addressing mechanism:

![Figure 3 — Basic addressing mechanism](image)

5.3.2 Role of the EID

The DSRC-EID (different from 0) is used to identify an EFC context, given by the EFC-ContextMark (see 6.2.3), in which Attributes can be addressed unambiguously by AttributeIDs. In the VST, the OBE may specify several of these EFC contexts, each corresponding to a set of EFC Attributes and EFC functions supported by it.

EXAMPLE

![Figure 4 — Role of the EID](image)

EID equals 0 shall be used to address application-independent functions and components, e.g. SET_MMI and TRANSFER_CHANNEL (see 7.2).

5.3.3 Multiple Instances of Attributes

There may be \( n \), where \( n \) is an integer, instances of an Attribute available in an OBE.

The maximum number of instances \( N_{\text{max}} \) of one Attribute may be limited according to the needs of operators and users. The default maximum number of instances is \( N_{\text{max}}=1 \). The value of \( N_{\text{max}} \) is determined at the time of OBE configuration.
EXAMPLE:

![Diagram of multiple instances (0-2) of attribute 5]

**Figure 5 — Multiple instances (0-2) of attribute 5**

The handling of multiple instances and the corresponding addressing mechanism are described in detail as part of the behaviour specification of the corresponding functions supporting multiple instances (see 7.2.6 for GET_INSTANCE and 7.2.7 for SET_INSTANCE).

### 5.4 Addressing of components

Components of an OBE to be addressed via the EFC Application Interface include for example:

- OBU;
- SAM 1;
- SAM 2;
- ICC;
- Display;
- Buzzer;
- Printer;
- Serial interface;
- Parallel interface;
- GPS;
- Tachograph;
- Bluetooth.

Addressing of these components is enabled on two levels, device-specific and device-independent addressing.

The **device-specific transparent addressing mechanism** enables the transfer of information, which shall be processed by the addressed device (such as an ICC-command). The addressed device is identified by a channel Id. The EFC function TRANSFER_CHANNEL (see 7.2.10) supports this functionality.

**EXAMPLE 1:** Transfer of a bit string to an ICC.

The **device-independent addressing mechanism** uses a set of commands, which describe a certain functionality, which can be performed by various OBU components. In this case, the operating system of the OBU will address the corresponding components. The EFC function SET_MMI supports this functionality (see 7.2.12).

**EXAMPLE 2:** Invocation of a SET_MMI(EID=0, ContactOperator) function activates an OBE MMI-device, e.g. a buzzer or a display.

**NOTE** In a specific implementation, specific attributes or data elements may activate some MMI function (e.g. a SET command on the attribute ReceiptText might display the text on an LCD display. A SET command on the attribute ReceiptServicePart with data element SessionResultOperational other than SessionOK might activate an alert beep). Proprietary addressing mechanisms are not defined by this document.
6 EFC Transaction Model

6.1 General

The EFC Transaction Model related to the EFC Application Interface for the DSRC comprises two phases, the initialisation phase and the transaction phase.

NOTE The purpose of the initialisation phase is to set up the communication between the RSE and OBEs that have entered the DSRC zone but have not yet established communication with the RSE, and to notify the application processes. It provides amongst others a multi-application switching mechanism, allowing for execution of several RTTT applications (in parallel) at one RSE station.

The transaction phase can only be reached after completion of the initialisation phase. The EFC functions, as defined in clause 7, can be performed in the transaction phase. The GET and SET services (DSRC application layer functions) as defined in EN 12834 / ISO/DIS 15628:2003 (in 6.2) may also be used in an EFC transaction phase.

6.2 Initialisation Phase

6.2.1 Overview

This Clause provides an overview of the functionality of, and the information exchanges in, the initialisation phase.

The Initialisation procedures, by means of beacon service table (BST) and vehicle service table (VST) exchanges, are defined in EN 12834 / ISO/DIS 15628. 6.2.2 and 6.2.3 below account for the EFC application-specific information that shall be included in the BST and VST, respectively.

NOTE The OBE evaluates the received BST, and selects the applications that it wishes to perform out of the lists of applications supported by the RSE. If the OBE does not support any of application(s) supported by the RSE, then it is recommended that the OBE does not exchange any information with the RSE. If the OBE supports at least one of the application(s) supported by the RSE, then it is recommended that the OBE informs the RSE of which application it wishes to execute in its corresponding VST.
The Initialisation service associated with the initialisation phase is only used by the Initialisation Kernel (of EN 12834 / ISO/DIS 15628), which in its turn is configured by the application(s) wishing to execute applications over a DSRC link. The Initialisation Kernels of the RSE and of the concerned OBE shall have been configured, according to EN 12834 / ISO/DIS 15628, prior to the invocation of the Initialisation service by the RSE.

6.2.2 EFC application-specific contents of the BST

An RSE supporting EFC shall have configured its Initialisation Kernel to carry the following information related specifically to the EFC application(s):

— the application identifier (AID) shall be equal to 1 (i.e. the value assigned for EFC);
— the EFC application shall be qualified as a mandatory application;
— EID shall not be transmitted in the BST related to the EFC application;
— no Parameter shall be transmitted in the BST related to the EFC application.

NOTE 1 Aid equals to 14 identifies the Multi-purpose payment context. In Japan, EN ISO 14906 specifies the application interface for DSRC used for multi-purpose payment (when the Aid=14 is used in Japan, the EID and parameter fields are defined through the BST).

There shall be only one EFC application present in the BST (i.e. there shall be only one instance of AID=1 in the BST) regardless of whether the RSE supports more than one EFC-ContextMark (see also 6.2.3).
