# Standarder får världen att fungera

*SIS (Swedish Standards Institute) är en fristående ideell förening med medlemmar från både privat och offentlig sektor. Vi är en del av det europeiska och globala nätverk som utarbetar internationella standarder. Standarder är dokumenterad kunskap utvecklad av framstående aktörer inom industri, näringsliv och samhälle och befrämjar handel över gränser, bidrar till att processer och produkter blir säkrare samt effektiviserar din verksamhet.*

## Delta och påverka

Som medlem i SIS har du möjlighet att påverka framtida standarder inom ditt område på nationell, europeisk och global nivå. Du får samtidigt tillgång till tidig information om utvecklingen inom din bransch.

## Ta del av det färdiga arbetet

Vi erbjuder våra kunder allt som rör standarder och deras tillämpning. Hos oss kan du köpa alla publikationer du behöver – allt från enskilda standarder, tekniska rapporter och standardpaket till handböcker och onlinetjänster. Genom vår webbtjänst e-nav får du tillgång till ett lättnavigerat bibliotek där alla standarder som är aktuella för ditt företag finns tillgängliga. Standarder och handböcker är källor till kunskap. Vi säljer dem.

## Utveckla din kompetens och lyckas bättre i ditt arbete

Hos SIS kan du gå öppna eller företagsinterna utbildningar kring innehåll och tillämpning av standarder. Genom vår närhet till den internationella utvecklingen och ISO får du rätt kunskap i rätt tid, direkt från källan. Med vår kunskap om standarders möjligheter hjälper vi våra kunder att skapa verklig nytta och lönsamhet i sina verksamheter.

**Vill du veta mer om SIS eller hur standarder kan effektivisera din verksamhet är du välkommen in på [www.sis.se](http://www.sis.se) eller ta kontakt med oss på tel 08-555 523 00.**

# Standards make the world go round

*SIS (Swedish Standards Institute) is an independent non-profit organisation with members from both the private and public sectors. We are part of the European and global network that draws up international standards. Standards consist of documented knowledge developed by prominent actors within the industry, business world and society. They promote cross-border trade, they help to make processes and products safer and they streamline your organisation.*

## Take part and have influence

As a member of SIS you will have the possibility to participate in standardization activities on national, European and global level. The membership in SIS will give you the opportunity to influence future standards and gain access to early stage information about developments within your field.

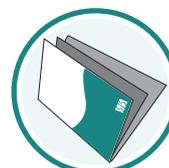

## Get to know the finished work

We offer our customers everything in connection with standards and their application. You can purchase all the publications you need from us - everything from individual standards, technical reports and standard packages through to manuals and online services. Our web service e-nav gives you access to an easy-to-navigate library where all standards that are relevant to your company are available. Standards and manuals are sources of knowledge. We sell them.

## Increase understanding and improve perception

With SIS you can undergo either shared or in-house training in the content and application of standards. Thanks to our proximity to international development and ISO you receive the right knowledge at the right time, direct from the source. With our knowledge about the potential of standards, we assist our customers in creating tangible benefit and profitability in their organisations.

**If you want to know more about SIS, or how standards can streamline your organisation, please visit [www.sis.se](http://www.sis.se) or contact us on phone +46 (0)8-555 523 00**

Den internationella standarden ISO 19453-1:2018 gäller som svensk standard. Detta dokument innehåller den officiella engelska versionen av ISO 19453-1:2018.

The International Standard ISO 19453-1:2018 has the status of a Swedish Standard. This document contains the official version of ISO 19453-1:2018.

© Copyright/Upphovsrätten till denna produkt tillhör SIS, Swedish Standards Institute, Stockholm, Sverige. Användningen av denna produkt regleras av slutanvändarlicensen som återfinns i denna produkt, se standardens sista sidor.

## SS-ISO 19453-1:2018 (E)

### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html)

This document was prepared by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 32, *Electrical and electronic components and general system aspects*.

A list of all parts in the ISO 19453 series can be found on the ISO website.

## Introduction

The purpose of ISO 19453 is to assist its user in systematically defining and/or applying a set of internationally accepted environmental conditions, tests and operating requirements based on the anticipated actual environment which the equipment will be operated in and exposed to during its life cycle. This document has been developed based on fundamental investigations and vehicle measurements on voltage class B components. Therefore, its scope is restricted to such components. However, this document can also be referred to for testing components such as electric motors, inverters and DC/DC converters used in supply voltage classes other than voltage class B if its applicability has been verified by, for example, vehicle measurements. The ISO 19453 series is based on the ISO 16750 series and follows the same basic principles, but is dedicated to voltage class B components.

Contrary to the ISO 16750 series, the ISO 19453 series contains no part 2 on electrical testing as those testing conditions and requirements are handled in ISO 21498.

The following environmental factors have been considered in the development of this document.

- World geography and climate

Electric propulsion vehicles are operated in nearly all land regions of the earth. Significant variations in environmental conditions due to climatic environment, including diurnal and seasonal cycles, can therefore be expected. Consideration has been given to worldwide ranges in temperature, humidity, precipitation and atmospheric conditions including dust, pollution and altitude.

- Type of electric propulsion vehicle

Environmental conditions in and on electric propulsion vehicles can depend on vehicle design attributes, such as whether to equip an internal combustion engine and/or an electric motor for vehicle propulsion, vehicle mass, vehicle size, electrical supply voltage and so on. Consideration has been given to typical series production electric propulsion vehicles, including hybrid electric vehicles, battery electric vehicles, range extender hybrid electric vehicles and fuel cell vehicles, but not including the equipment specific for fuel cell systems.

- Vehicle use conditions and operating modes

Environmental conditions in and on the vehicle vary significantly with road quality, types of road surface, road topography, vehicle use (e.g. commuting, towing, cargo transport, etc.) and driving habits. Operating modes such as storage, starting, driving, stopping and so on have been considered. Additionally, it has been taken into account that combustion engine speed distributions differ significantly for hybrid vehicles with electric driving modes during which the internal combustion engine is completely shut off.

- Equipment life cycle

Electrical and electronic equipment is also resistant to environmental conditions experienced during manufacture, shipping, handling, storage, vehicle assembly and vehicle maintenance and repair. Such conditions and tests (e.g. handling drop test) are within the scope of this document.

- Vehicle supply voltage

For electrical and electronic equipment with different supply voltages, these voltages are considered for the specification of operating modes applied for testing.

- Component mass and volume

Current components of the drive system of electrically propelled road vehicles tend to be much larger and heavier than conventional, small and light E/E equipment for which the test conditions are covered by the ISO 16750 series. The size and mass of components of the electric powertrain have been considered in this ISO 19453 series, for example, by taking the inertia mass of those components into account as an effect on the measured excitation during vibration measurements. Also, the size and mass significantly influence the necessary dwell time at low and high temperatures when applying a thermal

## SS-ISO 19453-1:2018 (E)

profile, such as in ISO 19453-4, as it takes much longer to reach the intended temperature in the core of the component.

### — Mounting location in the vehicle

In current or future vehicle concepts, systems/components are mounted in almost any location of the vehicle. The environmental requirements for each specific application highly depend on its mounting location. Each location in a vehicle has its distinct set of environmental loads. As an example, the range of temperatures in the engine compartment differs significantly from the range in the passenger compartment. This is also true for the vibration loads, except that in this case, not only are the vibration levels different, but the type of vibration load also varies. Body mounted components are typically exposed to random vibrations whereas for engine mounted systems/components the additional sine vibration from the engine is considered. Moreover, devices installed in doors are exposed to a high number of mechanical shocks from door slamming.

It is desirable for the vehicle manufacturer to group the different environmental load types and levels in a reasonable number of standard requirement sets. This strategy makes it possible to carry systems/components from one vehicle project to another. Furthermore, the exact requirement levels are often unknown when designing a component for a future vehicle concept. The expected environmental loads are usually compiled from other vehicle concepts with similar conditions. The grouping is normally done by mounting location, but it is difficult to define the right number of different mounting locations and respective load profiles, because there is a conflict of aims between having only few requirement classes and tailoring the requirement levels to each application. The reason is that the environmental loads are not only depending on the mounting location. There are other major factors that affect the stress levels for systems/components. For example, body styles, drive-train concepts or package densities can create absolutely different requirement levels for devices that are installed in different vehicles at almost the same location.

The purpose of ISO 19453 is to define requirement classes for separate load types. It distinguishes between electrical, mechanical, thermal, climatic and chemical loads. For each load type, several requirement classes are defined. Every requirement class is determined by a specific code letter. The complete environmental requirement set is created by defining the code letter combination. The code letters are defined in the respective clauses of this document. Additionally, tables in the annexes of each part show the usual mounting locations and give examples of their respective code letters. For normal applications, these code letters are used. If an application is very specific and therefore the given code letter combinations cannot be used, it is possible to create new code letter combinations to serve this purpose. In case none of the given code letters is useable, new requirement levels can be created by using the code letter Z. In this case, the specific requirements are defined separately, but it is desirable not to change the test methods.

At a minimum, the following mounting locations should be considered for a device under test (DUT) with respect to thermal, mechanical, climatic and chemical loads.

#### a) Applicability to manufacturer's responsibility

Due to technology limitations or variations in vehicle design, the vehicle manufacturer can be required to place a component in a location where it cannot withstand the environmental conditions described in ISO 19453. Under these circumstances, it is the responsibility of the vehicle manufacturer to provide the necessary environmental protection.

#### b) Applicability to wiring harnesses, cables and electrical connectors

Although some environmental conditions and tests in ISO 19453 can be relevant to vehicle wiring harnesses, cables and connectors, its scope is not sufficient to be used as a complete standard. It is therefore not recommended that ISO 19453 be directly applied to such devices and equipment.

#### c) Applicability to parts or assemblies inside equipment

ISO 19453 describes environmental conditions and tests to be applied to electrical and electronic equipment directly mounted in or on the vehicle. It is not intended for direct application to parts or assemblies that are part of the equipment. For example, ISO 19453 should not be directly applied to

integrated circuits (ICs) and discrete components, electrical connectors, printed circuit boards (PCBs), gauges, etc. that are attached in or on the equipment. Electrical, mechanical, climatic and chemical loads for such parts and assemblies can be quite different from those described in ISO 19453. Therefore, for those sub-components, the test conditions of ISO 16750 can be considered as a reference.

On the other hand, it is desirable to use ISO 19453 to help derive environmental conditions and test requirements for parts and assemblies that are intended for use in road vehicle equipment. For example, a temperature range of  $-40\text{ °C}$  to  $90\text{ °C}$  may be specified for an assembly contained inside a piece of equipment having a temperature range of  $-40\text{ °C}$  to  $70\text{ °C}$  and an additional temperature rise of  $20\text{ K}$ .

d) Applicability relative to system integration and validation

The user of ISO 19453 is cautioned to understand that the scope of ISO 19453 is limited to conditions and testing at the equipment level, and therefore does not represent all conditions and testing necessary for complete verification and validation of the vehicle system. Environmental and reliability testing of equipment parts and vehicle systems can be required.

For example, ISO 19453 does not necessarily ensure that environmental and reliability requirements for solder joints, solderless connections, integrated circuits and so on are met. Such items are ensured at the part, material or assembly level. Additionally, vehicle and system level testing can be required to validate the equipment in the vehicle application.

# Road vehicles — Environmental conditions and testing for electrical and electronic equipment for drive system of electric propulsion vehicles —

## Part 1: General

### 1 Scope

This document specifies requirements for the electric propulsion systems and components with maximum working voltages according to voltage class B. It does not apply to high voltage battery packs (e.g. for traction) and systems or components inside. It describes the potential environmental stresses and specifies tests and requirements recommended for different stress levels on/in the vehicle.

This document contains definitions and general requirements. Like all other parts of the 19453 series, it is not intended to apply to environmental requirements or testing for:

- wiring harnesses, cables and electrical connectors;
- parts or assemblies inside an equipment, if not otherwise specified;
- system integration of equipment and system validation on vehicle level, if not otherwise specified in a test requirement.

### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
