SIS
SWEDISH
STANDARDS
INSTITUTE

Standarder får världen att fungera

SIS (Swedish Standards Institute) är en fristående ideell förening med medlemmar från både privat och offentlig sektor. Vi är en del av det europeiska och globala nätverk som utarbetar internationella standarder. Standarder är dokumenterad kunskap utvecklad av framstående aktörer inom industri, näringsliv och samhälle och befrämjar handel över gränser, bidrar till att processer och produkter blir säkrare samt effektiviserar din verksamhet.

Delta och påverka
Som medlem i SIS har du möjlighet att påverka framtida standarder inom ditt område på nationell, europeisk och global nivå. Du får samtidigt tillgång till tidig information om utvecklingen inom din bransch.

Ta del av det färdiga arbetet
Vi erbjuder våra kunder allt som rör standarder och deras tillämpning. Hos oss kan du köpa alla publikationer du behöver – allt från enskilda standarder, tekniska rapporter och standard-paket till handböcker och onlinetjänster. Genom vår webbtjänst e-nav får du tillgång till ett lättnavigerat bibliotek där alla standarder som är aktuella för ditt företag finns tillgängliga. Standarder och handböcker är källor till kunskap. Vi säljer dem.

Utveckla din kompetens och lyckas bättre i ditt arbete
Hos SIS kan du gå öppna eller företagsinterna utbildningar kring innehåll och tillämpning av standarder. Genom vår närhet till den internationella utvecklingen och ISO får du rätt kunskap i rätt tid, direkt från källan. Med vår kunskap om standarders möjligheter hjälper vi våra kunder att skapa verklig nytta och lönsamhet i sina verksamheter.

Vill du veta mer om SIS eller hur standarder kan effektivisera din verksamhet är du välkommen in på www.sis.se eller ta kontakt med oss på tel 08-555 523 00.
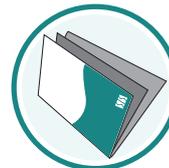

Standards make the world go round

SIS (Swedish Standards Institute) is an independent non-profit organisation with members from both the private and public sectors. We are part of the European and global network that draws up international standards. Standards consist of documented knowledge developed by prominent actors within the industry, business world and society. They promote cross-border trade, they help to make processes and products safer and they streamline your organisation.

Take part and have influence
As a member of SIS you will have the possibility to participate in standardization activities on national, European and global level. The membership in SIS will give you the opportunity to influence future standards and gain access to early stage information about developments within your field.

Get to know the finished work
We offer our customers everything in connection with standards and their application. You can purchase all the publications you need from us - everything from individual standards, technical reports and standard packages through to manuals and online services. Our web service e-nav gives you access to an easy-to-navigate library where all standards that are relevant to your company are available. Standards and manuals are sources of knowledge. We sell them.

Increase understanding and improve perception
With SIS you can undergo either shared or in-house training in the content and application of standards. Thanks to our proximity to international development and ISO you receive the right knowledge at the right time, direct from the source. With our knowledge about the potential of standards, we assist our customers in creating tangible benefit and profitability in their organisations.

If you want to know more about SIS, or how standards can streamline your organisation, please visit www.sis.se or contact us on phone +46 (0)8-555 523 00

Denna tekniska specifikation är inte en svensk standard. Detta dokument innehåller den engelska språkversionen av CEN/TS 17329-1:2019, utgåva 1.

This Technical Specification is not a Swedish Standard. This document contains the English language version of CEN/TS 17329-1:2019, edition 1.

Upplysningar om sakinnehållet i detta dokument lämnas av SIS, Swedish Standards Institute, telefon 08-555 520 00. Standarder kan beställas hos SIS som även lämnar allmänna upplysningar om nationell och internationell standard.

Information about the content of this document is available from the SIS, Swedish Standards Institute, telephone +46 8 555 520 00. Standards may be ordered from SIS, who can also provide general information about national and international standards.

Dokumentet är framtaget av kommittén för Livsmedelsanalyser, SIS/TK 435/AG 05.

Har du synpunkter på innehållet i det här dokumentet, vill du delta i ett kommande revideringsarbete eller vara med och ta fram standarder inom området? Gå in på www.sis.se - där hittar du mer information.

TECHNICAL SPECIFICATION

SPÉCIFICATION TECHNIQUE

TECHNISCHE SPEZIFIKATION

CEN/TS 17329-1

April 2019

ICS 67.050

English Version

Foodstuffs - General guidelines for the validation of qualitative real-time PCR methods - Part 1: Single-laboratory validation

Denrées alimentaires - Lignes directrices générales pour la validation des méthodes de PCR qualitative en temps réel - Partie 1 : Validation intralaboratoire	Lebensmittel - Allgemeine Anleitung für die Validierung qualitativer Realtime-PCR-Verfahren - Teil 1: Einzellaborvalidierung

This Technical Specification (CEN/TS) was approved by CEN on 25 February 2019 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

European foreword

This document (CEN/TS 17329-1:2019) has been prepared by Technical Committee CEN/TC 275 "Food analysis - Horizontal methods", the secretariat of which is held by DIN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document consists of two parts:

— Part 1: Single-laboratory validation

— Part 2: Collaborative study

According to the CEN/CENELEC Internal Regulations, the national standards organisations of the following countries are bound to announce this Technical Specification: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

SIS-CEN/TS 17329-1:2019 (E)

Introduction

Qualitative real-time polymerase chain reaction (PCR) methods currently find broad application for the detection of specific DNA sequences in food, e.g. for the detection and identification of genetically modified organisms and the products derived thereof, for food authentication and speciation and other purposes. It is important that a newly developed food analytical method is fit-for-purpose and meets certain performance characteristics and quality criteria as demonstrated by a particular set of validation experiments.

The data determined by the single laboratory validation are the basis for the decision to apply a method in-house. Furthermore, it helps to decide whether the method in question should be fully validated in the framework of a collaborative study.

The aim of this document is to provide a protocol for single-laboratory validation of qualitative real-time PCR methods which are applied for food analysis. The procedure described is a recommendation that is underpinned by practical experience in several laboratories. It is possible to apply alternative approaches for which it can be shown that the performance criteria mentioned in the present document are achieved.

1 Scope

This document describes the performance characteristics and minimum performance criteria which should be taken into account when conducting a single-laboratory validation study for qualitative (binary) real-time polymerase chain reaction (PCR) methods applied for the detection of specific DNA sequences present in foods.

The protocol was developed for qualitative real-time PCR methods for the detection of DNA sequences derived from genetically modified foodstuffs. It is applicable also for single-laboratory validation of qualitative PCR methods used for analysis of other food materials, e.g. for species detection and identification.

The document does not cover the evaluation of the applicability and the practicability with respect to the specific scope of the PCR method.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN ISO 21571:2005, *Foodstuffs - Methods of analysis for the detection of genetically modified organisms and derived products - Nucleic acid extraction (ISO 21571:2005)*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 16577 and EN ISO 24276 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— IEC Electropedia: available at http://www.electropedia.org/

— ISO Online browsing platform: available at http://www.iso.org/obp

3.1
probability of detection
POD
probability of a positive analytical outcome of a qualitative method for a given matrix at a given concentration

Note 1 to entry: For a qualitative real-time PCR method it describes the probability that, for a given number of DNA copies of the target sequence, PCR amplification will take place.

3.2
PCR efficiency
measured amplification rate for a DNA copy of the target sequence per PCR cycle in relation to the theoretically achievable value of 1

Note 1 to entry: The PCR efficiency is calculated from the slope of a standard curve resulting from the decadic semi-logarithmic plot of quantification cycle (Cq) values over the DNA concentration. The slope from the calculated regression line can be used. The PCR efficiency can either be expressed as absolute number or as percentage.

3.3
limit of detection
$LOD_{95\%}$
mean number of copies of the target sequence yielding a probability of detection of 0,95

4 Principle

Specific primers and also probes, depending on the detection system applied, have been designed for specific amplification of a DNA target sequence by a qualitative real-time PCR method. As next step the methods performance characteristics needs to be assessed to show that the method complies with the quality criteria stipulated in relevant documents [1] [2].

According to the published guidelines the main criteria in the single-laboratory validation of a qualitative real-time PCR method mainly concerns the limit of detection (at which the probability of detection is ≥ 95 %), the specificity for the DNA target sequence and the robustness to small but deliberate variations in the method parameters.

On the basis of the validation data, it can be verified whether the minimum required performance criteria are fulfilled. This will be the basis for the applicability of the method by a single laboratory. A further decision whether to conduct a validation of the method in the framework of a collaborative study can then be taken.

Determination of the reproducibility (inter-laboratory transferability) and how the method performs at different laboratories, in particular the false-positive/false-negative rate obtained with negative/positive test samples, and the probability of detection (POD) across laboratories are evaluated by a collaborative study, if the design is appropriate [3].

General guidelines for conducting a collaborative validation study are provided in Part 2 of this Technical Specification.

5 Single-laboratory validation of the performance characteristics

5.1 General

Guidance for compiling the information required for complete and detailed description of all components that should be provided with the protocol of the qualitative PCR methods (i.e. oligonucleotide sequences, amplicon length, instrument or chemistry specifications, PCR conditions, analytical controls etc.) is described in other relevant documents [1] [2].

DNA extraction shall be according to the requirements and procedures specified in EN ISO 21571.

5.2 Limit of detection ($LOD_{95\%}$)

In qualitative PCR analysis (especially for the detection of genetically modified foodstuffs), the limit of detection is usually defined as the amount of the target DNA at which an amplification product is detected with a probability of at least 0,95 ($LOD_{95\%}$). It is expressed in the number of copies of the target sequence.

The $LOD_{95\%}$ should be determined by means of a dilution series of the target DNA, using a uniform concentration of non-target DNA (background DNA) for each dilution level.

Annex A provides additional detailed information regarding the copy number estimation of the target DNA. Annex C provides the basics of the specific statistical model adapted for PCR methods.

For each dilution level, perform 12 PCR replicate measurements.[1] The lowest dilution level (i.e. the lowest number of copies) for which all 12 replicates are positive is considered to be an approximate value for $LOD_{95\%}$ (see B.2).[2] The $LOD_{95\%}$ of the qualitative real-time PCR method should not exceed 20 copies of the target sequence.

The number of copies of the target sequence can be calculated on basis of haploid genome equivalents using the measured DNA concentration (see EN ISO 21571:2005, Annex B; [4]) and the genome weight [5] [6] [7]. The use of digital PCR equipment (e.g. digital droplet PCR) is an alternative approach which allows an accurate determination of the number of copies of a target sequence or the concentration of a DNA solution [8].

The quality and the concentration (very high or very low) of the background DNA used for the dilution can influence the validation experiment. It is therefore highly recommended to use DNA tested for the absence of PCR inhibitors (e.g. commercial molecular biology grade DNA preparations) and a concentration which is relevant for DNA extracted from food.

Practical guidance which has been experimentally proven is given in Annex B.

5.3 Evaluation of data for the limit of detection ($LOD_{95\%}$)

Determine the $LOD_{95\%}$, the mean POD curve, and the 95 % confidence interval by means of a statistical model, e.g. the complementary log-log model and the likelihood ratio test [3]. Details on the statistical model are given in Annex C. For the calculation, the nominal copies added to the PCR reaction, the number of replicates and the number of positive results are required.

The complementary log-log model corresponds to applications where we observe either zero events (e.g. defects) or one or more events where the number of events is assumed to follow the Poisson distribution.

The $LOD_{95\%}$, the 95 % confidence interval and the mean POD curve along with the corresponding 95 % confidence range can be calculated via a web service [9].

Check the $LOD_{95\%}$ for plausibility. A value significantly smaller than 2,996 suggests that the number of copies of the target sequence that were actually added to the PCR reaction did not correspond to the (nominal) numbers of copies estimated for the DNA solutions [3].

If more than two results are positive at the level with 0,1 copies of the target sequence per PCR, then the DNA dilutions cannot be considered as verified and the number of copies has to be re-examined.

NOTE 1 The calculation of $LOD_{95\%}$ is only valid if false-positive results are negligible, i.e. if the specificity testing was successful and PCR carry-over contamination can be excluded.

NOTE 2 The level which will be the result of a tenfold dilution of 1 nominal copy is designated "level with 0,1 copies per PCR" for the sake of better readability throughout this Technical Specification.

5.4 PCR efficiency and variability of the measured copy number around the $LOD_{95\%}$

For the optional determination of copy numbers around the limit of detection, assign the copy numbers to the respective Cq values on the basis of an additional calibration series of target DNA (preparation, see Annex B, Table B.1).

---

[1] The statistical approach is described in [4].

[2] This document is relevant for the validation of new methods. However, for method verification, 10 replicates can be sufficient.
