Standarder får världen att fungera

SIS (Swedish Standards Institute) är en fristående ideell förening med medlemmar från både privat och offentlig sektor. Vi är en del av det europeiska och globala nätverk som utarbetar internationella standarder. Standarder är dokumenterad kunskap utvecklad av framstående aktörer inom industri, näringsliv och samhälle och befrämjar handel över gränser, bidrar till att processer och produkter blir säkrare samt effektiviserar din verksamhet.

Delta och påverka

Som medlem i SIS har du möjlighet att påverka framtida standarder inom ditt område på nationell, europeisk och global nivå. Du får samtidigt tillgång till tidig information om utvecklingen inom din bransch.

Ta del av det färdiga arbetet

Vi erbjuder våra kunder allt som rör standarder och deras tillämpning. Hos oss kan du köpa alla publikationer du behöver – allt från enskilda standarder, tekniska rapporter och standardpaket till handböcker och onlinetjänster. Genom vår webbtjänst e-nav får du tillgång till ett lättnavigerat bibliotek där alla standarder som är aktuella för ditt företag finns tillgängliga. Standarder och handböcker är källor till kunskap. Vi säljer dem.

Utveckla din kompetens och lyckas bättre i ditt arbete

Hos SIS kan du gå öppna eller företagsinterna utbildningar kring innehåll och tillämpning av standarder. Genom vår närhet till den internationella utvecklingen och ISO får du rätt kunskap i rätt tid, direkt från källan. Med vår kunskap om standarders möjligheter hjälper vi våra kunder att skapa verklig nytta och lönsamhet i sina verksamheter.

Vill du veta mer om SIS eller hur standarder kan effektivisera din verksamhet är du välkommen in på www.sis.se eller ta kontakt med oss på tel 08-555 523 00.

Standards make the world go round

SIS (Swedish Standards Institute) is an independent non-profit organisation with members from both the private and public sectors. We are part of the European and global network that draws up international standards. Standards consist of documented knowledge developed by prominent actors within the industry, business world and society. They promote cross-border trade, they help to make processes and products safer and they streamline your organisation.

Take part and have influence

As a member of SIS you will have the possibility to participate in standardization activities on national, European and global level. The membership in SIS will give you the opportunity to influence future standards and gain access to early stage information about developments within your field.

Get to know the finished work

We offer our customers everything in connection with standards and their application. You can purchase all the publications you need from us - everything from individual standards, technical reports and standard packages through to manuals and online services. Our web service e-nav gives you access to an easy-to-navigate library where all standards that are relevant to your company are available. Standards and manuals are sources of knowledge. We sell them.

Increase understanding and improve perception

With SIS you can undergo either shared or in-house training in the content and application of standards. Thanks to our proximity to international development and ISO you receive the right knowledge at the right time, direct from the source. With our knowledge about the potential of standards, we assist our customers in creating tangible benefit and profitability in their organisations.

If you want to know more about SIS, or how standards can streamline your organisation, please visit www.sis.se or contact us on phone +46 (0)8-555 523 00

Europastandarden EN 16845-1:2017 gäller som svensk standard. Detta dokument innehåller den officiella engelska versionen av EN 16845-1:2017.

The European Standard EN 16845-1:2017 has the status of a Swedish Standard. This document contains the official version of EN 16845-1:2017.

NORME EUROPÉENNE

EUROPÄISCHE NORM

March 2017

ICS 25.220.20

English Version

**Photocatalysis - Anti-soiling chemical activity using
adsorbed organics under solid/solid conditions - Part 1:
Dyes on porous surfaces**

Photocatalyse - Activité chimique anti-salissures à l'aide de matières organiques adsorbées dans des conditions solide/solide - Partie 1 : Colorants sur des surfaces poreuses

Photokatalyse - Schmutzabweisende, chemische Aktivität unter Verwendung adsorbierender organischer Stoffe im Zustand fest/fest - Teil 1: Farbstoffe auf porösen Oberflächen

This European Standard was approved by CEN on 14 November 2016.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

European foreword

This document (EN 16845-1:2017) has been prepared by Technical Committee CEN/TC 386 “Photocatalysis”, the secretariat of which is held by AFNOR.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by September 2017, and conflicting national standards shall be withdrawn at the latest by September 2017.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

EN 16845, *Photocatalysis — Anti-soiling chemical activity using adsorbed organics under solid/solid conditions*, is dedicated to anti-soiling chemical activity using adsorbed organics under solid/solid conditions and is constituted by the following parts:

- *Part 1: Dyes on porous surfaces;*
- *Part 2: Simulated weathering conditions.*

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

1 Scope

This European Standard specifies a test method for the evaluation of the photocatalytic self-cleaning performance of materials showing photocatalytic activity, usually based on semiconducting metal oxides such as titanium dioxide, by the measurement under solid/solid conditions of the decolouring ability under irradiation with ultraviolet light (UV-A) of a test sample on which a dye solution is sprayed and dried.

This European Standard is intended for use with opaque and rough surfaces of different kinds, such as construction materials in flat sheet, board or plate shape, that are the basic forms of materials for various applications.

This European Standard also applies to fabric, plastic or composites containing photocatalytic materials that are not soluble in acetone. This European Standard does not apply to photocatalytic glass, granular materials (unless they are deposited in compact films or layers over flat solid surface) and flat non porous materials.

The method evaluates only the self-cleaning ability of the material under ultraviolet light irradiation. It cannot be applicable to evaluate other performance attributes of photocatalytic materials, i.e. decomposition of water contaminants in liquid or gas phases contacting the material, and antifogging and antibacterial actions.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

CEN/TS 16599, *Photocatalysis - Irradiation conditions for testing photocatalytic properties of semiconducting materials and the measurement of these conditions*

CEN/TS 16981, *Photocatalysis — Glossary of terms*

EN ISO/IEC 17025, *General requirements for the competence of testing and calibration laboratories (ISO/IEC 17025:2005)*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in CEN/TS 16981 and the following apply.

3.1

self-cleaning

ability of a material to maintain clean or to clean itself if soiled on its surface

3.2

photocatalytic self-cleaning

self-cleaning ability of a material as a consequence of the irradiation of the material surface with UV-VIS-IR radiation

3.3

spraying distance

distance from the outlet of the spraying gun (see experimental setup) and the surface of the test sample

SS-EN 16845-1:2017 (E)

3.4 covered area

CA
area of the sample where the colour intensity is $\geq \exp(-2) \approx 13,5\%$ of the maximum intensity

3.5 dirt parameter

DP
dye amount spread or persistent over the sample surface

3.6 dirt parameter calibration function

mathematical function that describes the relation between the Dirt Parameter and the amount of dye spread over the sample surface

4 Symbols and abbreviations

a, b, c	polynomial constant parameters obtained by the fit using Formula (7)
$A_{\text{net}}(\lambda)$	Net Absorbance of the dye covering of the sample surface at the wavelength λ
CA	Covered Area (cm^2)
C_{dye}	concentration of the dye in the spraying solution (g cm^{-3})
d_{ac}	density of acetone at the temperature of the measurement (g cm^{-3})
DP	dirt parameter (nm): the parameter is indexed depending on the context
DR	deposition rate ($\text{g s}^{-1} \text{cm}^{-2}$)
f	volumetric spraying flow ($\text{cm}^3 \text{s}^{-1}$)
F_i	mass flow (g s^{-1})
k_{dye}	first order kinetic constant of the specified dye for the photocatalytic self-cleaning process (min^{-1})
MW	molecular weight
n	number of steps used for deposition of the dye on the sample surface; typically, $n = 5$, but can be larger if the surface is excessively wet
$R(\lambda)$	spectral reflectance at the wavelength λ of the sample surface; $R(\lambda)$ has indexes i and j referring to steps of spraying and illumination, respectively
$R_{\text{background}}(\lambda)$	reflectance of the pristine surface at the wavelength λ
SC	standard dye covering defined in Table 2 (g cm^{-2})
T	temperature in $^{\circ}\text{C}$
t_i	irradiation time in min
t^{spr}	spraying time (s), calculated as $t^{\text{spr}} = t_{\text{std}}^{\text{spr}} / n$
W	the full width at half maximum (FWHM) of the sprayed dye colour peak (cm)
β	average covering of dye at the surface (g cm^{-2}); indexes i and j refer to steps of spraying and illumination, respectively
β_0	maximum average covering of dye at the surface (g cm^{-2}), obtained at $t_{\text{std}}^{\text{spr}}$

λ	wavelength (nm)
λ_{\max}	wavelength (nm) at which there is a maximum of absorbance
t_{std}^{spr}	standard spraying time (s)
$\tau_{1/2}^{dye}$	half-life of the dye for the photocatalytic self-cleaning process (min)

5 Principle

This standard concerns the comparison and the quality assurance of photocatalytic materials used as self-cleaning materials. The method described is intended to measure the photocatalytic self-cleaning performance of a photocatalytic material by evaluating its ability to clean its surface, previously covered by a known amount of coloured organic compound, as a consequence of the exposition to ultraviolet light. A controlled amount of a dye solution dissolved in a volatile solvent (acetone) is spread on the tested surface by using a spraying gun.

The photocatalytic material turns out to be covered by the solid dye. The relation between the amount of the spread dye and the spectrophotometric reflectance is defined in the calibration step. The calibration function involves the measurement of the reflectance spectra of the sample surface as a function of the dyes covering. Dyes used in separate experiments are Metanil Yellow, Rhodamine B, and Methylene Blue. The test shall be carried out with the dye showing the maximum optical contrast with the material to be tested. Criteria for the choice of the best dye are here given (see 8.3.2). Optionally, the test can be carried out with the others dyes as the reactivity of each dye can depend on the specimen. The measurement with more than one dye is encouraged, but it is not compulsory. The self-cleaning activity measured by this test shall be referred to the used dye.

The soiled surface is then irradiated in air by UV-A light under defined conditions and the decrease of the dye amount on the surface is monitored by measuring the reflectance spectra of the surface of the test sample in the visible range. By using the calibration function the change of the reflectance spectra can be related to the kinetic of disappearance of the dye from the surface. The photocatalytic self-cleaning performance is determined as the half-life (minutes) of the dyes applied to the surface.

6 Instruments

6.1 Spraying system

The method described in this standard relies on the possibility to cover the sample surface with the dye in a controlled way. A spraying system shall be used to spread over the sample surface a solution of the dye (dye solution) in volatile solvent (acetone). The spraying system consists of a sample support and in a pneumatic system under pressure able to spray the dye solution over the sample for different definite times. The dye solution shall be spread by using a spraying gun that forms a circular spot. This involves a normal (Gaussian) distribution of the amount of dye centred in the spot of the dye on the surface. The amount of solution spread over the test sample is controlled by changing the spraying time (t^{spr}) with a timer that opens and closes, with a precision of $\pm 0,01$ s, the dye solution flow. The relative distance and orientation between the gun and the sample shall be changed in a way to obtain a symmetric covering of the surface of the test sample and the desired surface covered area. Due to the normal distribution of the colour intensity at the test piece surface, the dye surface covered area is defined as the area of the sample where the colour intensity is $\geq \exp(-2)$ approximately 13,5 % of the maximum intensity (see 8.2). The optimal distance from the gun outlet to the surface of the test sample is referred as the spraying distance.

A sketch of the pneumatic spraying system and of the sample support is shown in Figure 1 and Figure 2.
