Standarder får världen att fungera

SIS (Swedish Standards Institute) är en fristående ideell förening med medlemmar från både privat och offentlig sektor. Vi är en del av det europeiska och globala nätverk som utarbetar internationella standarder. Standarder är dokumenterad kunskap utvecklad av framstående aktörer inom industri, näringsliv och samhälle och befrämjar handel över gränser, bidrar till att processer och produkter blir säkrare samt effektiviserar din verksamhet.

Delta och påverka

Som medlem i SIS har du möjlighet att påverka framtida standarder inom ditt område på nationell, europeisk och global nivå. Du får samtidigt tillgång till tidig information om utvecklingen inom din bransch.

Ta del av det färdiga arbetet

Vi erbjuder våra kunder allt som rör standarder och deras tillämpning. Hos oss kan du köpa alla publikationer du behöver – allt från enskilda standarder, tekniska rapporter och standardpaket till handböcker och onlinetjänster. Genom vår webbtjänst e-nav får du tillgång till ett lättnavigerat bibliotek där alla standarder som är aktuella för ditt företag finns tillgängliga. Standarder och handböcker är källor till kunskap. Vi säljer dem.

Utveckla din kompetens och lyckas bättre i ditt arbete

Hos SIS kan du gå öppna eller företagsinterna utbildningar kring innehåll och tillämpning av standarder. Genom vår närhet till den internationella utvecklingen och ISO får du rätt kunskap i rätt tid, direkt från källan. Med vår kunskap om standarders möjligheter hjälper vi våra kunder att skapa verklig nytta och lönsamhet i sina verksamheter.

Vill du veta mer om SIS eller hur standarder kan effektivisera din verksamhet är du välkommen in på www.sis.se eller ta kontakt med oss på tel 08-555 523 00.

Standards make the world go round

SIS (Swedish Standards Institute) is an independent non-profit organisation with members from both the private and public sectors. We are part of the European and global network that draws up international standards. Standards consist of documented knowledge developed by prominent actors within the industry, business world and society. They promote cross-border trade, they help to make processes and products safer and they streamline your organisation.

Take part and have influence

As a member of SIS you will have the possibility to participate in standardization activities on national, European and global level. The membership in SIS will give you the opportunity to influence future standards and gain access to early stage information about developments within your field.

Get to know the finished work

We offer our customers everything in connection with standards and their application. You can purchase all the publications you need from us - everything from individual standards, technical reports and standard packages through to manuals and online services. Our web service e-nav gives you access to an easy-to-navigate library where all standards that are relevant to your company are available. Standards and manuals are sources of knowledge. We sell them.

Increase understanding and improve perception

With SIS you can undergo either shared or in-house training in the content and application of standards. Thanks to our proximity to international development and ISO you receive the right knowledge at the right time, direct from the source. With our knowledge about the potential of standards, we assist our customers in creating tangible benefit and profitability in their organisations.

If you want to know more about SIS, or how standards can streamline your organisation, please visit www.sis.se or contact us on phone +46 (0)8-555 523 00

Den internationella standarden ISO 19155:2012 gäller som svensk standard. Detta dokument innehåller den officiella engelska versionen av ISO 19155:2012.

The International Standard ISO 19155:2012 has the status of a Swedish Standard. This document contains the official version of ISO 19155:2012.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 19155 was prepared by Technical Committee ISO/TC 211, *Geographic information/Geomatics*.

Introduction

The rapid development of information technology has blurred the boundaries between the real and virtual worlds in such a way that they cannot easily be disassociated from each other. Humans can reference places in both worlds and easily differentiate between them. However for computers to clearly differentiate these places, a set of matched linkages between them are required.

In the discipline of geography, space normally refers to the surface of the earth. However, in other disciplines, space can refer to different paradigms. In architecture, space may be the extent of a room or a building. In mathematics, space is defined as a set having structure. In the context of the World Wide Web space is defined by URLs/URIs that identify web pages.

Within this International Standard “space” is considered as a set having structure, in which a position or location identifies an element.

Currently, within the domain of ISO/TC 211, standards exist for precise positioning and locating using either coordinates or geographic identifiers. However, the concept of place is broader than both position and location. A “place” is referred to as a “position” when that place is identified using coordinates. Similarly, a “place” is referred to as a “location” when that place is identified using geographic identifiers. However, existing standards defined by ISO/TC 211 do not provide a mechanism for the representation of a virtual “place” such as a website, or a construct acting as a “common base” which can be used to refer to the other types of identifiers.

Within this International Standard, “place” is defined as an identifiable part of any space. This may include “places” existing not only in the real world but also those in the virtual world. Places are identified using either “position” by coordinates, “location” by geographic identifiers, or “virtual world identifiers” such as a URI.

In this International Standard, the identifier of a place is referred to as a Place Identifier (PI). A single “place” may be identified using several separate Place Identifiers. Clarification of these relationships is shown in Figure 1.

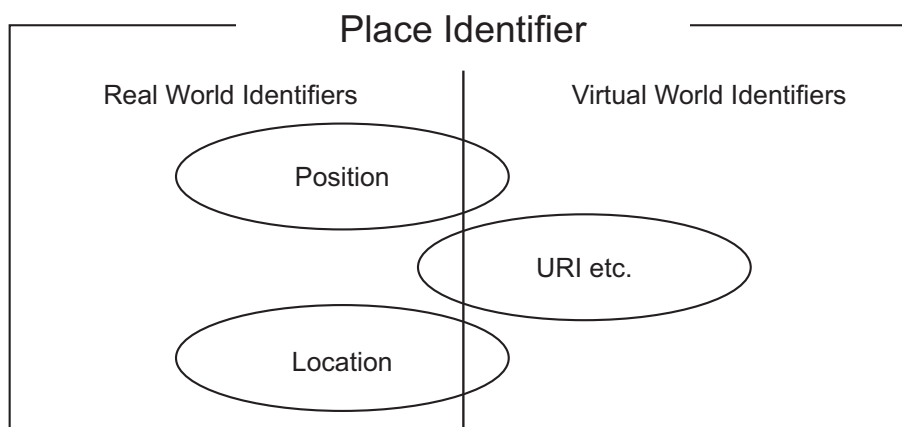

Figure 1 — Relationships among place, position, location and URI

Place descriptions are used for information retrieval. In reality, those identifiers often refer to the same place. Currently these relationships are difficult for machines to correctly distinguish, which impedes the discovery and retrieval of information. The conceptual architecture and reference model defined in this International Standard provides a mechanism for solving these problems.

When implemented, this architecture would enable the access and sharing of place descriptions using the Place Identifier as the standardized method.

Within the reference model, place descriptions are defined using a PI. A PI consists of a reference system (RS), a value, and the valid temporal period of that value.

SS-ISO 19155:2012 (E)

The internal format and content of the value are determined by each community or domain. The content of the values are not subject to any kind of standardization or unification by this International Standard. The RS is also defined by each community, and should be unique across multiple communities. Subsequently, Place Identifiers are unique within each RS. However, the values of the Place Identifiers may be similar or even identical across multiple communities. This distributed concept ensures that each community would maintain their own Place Identifiers. Well formed Place Identifiers may be shared between communities.

Instead of specifying a framework for a globally unique type of identifier, the key idea of the architecture defined in this International Standard enables the original place descriptions to be easily maintained, without requiring difficult conversions and cross-community harmonization.

An encoding scheme based on Geography Markup Language (GML) (ISO 19136:2007) is normatively defined in this International Standard. In addition, a group of alternate encoding schemes are presented as informative annexes. Depending on the encoding method of choice, globally unique Place Identifiers may be created resulting from the requirements of the encoding method used.

Methods for the conversion of “located features” to Place Identifiers are not covered within the scope of this International Standard. While the direct relationship with the PI Architecture and other Spatial Data Infrastructures (SDIs) is not explained, an implementation of the PI Architecture can be considered part of an SDI. Various constructs, such as registries and databases, may be used to store Place Identifiers. The flexible structure of the Place Identifier will allow for data stored in common GI systems to be easily registered as Place Identifiers, however, the design and implementation of those procedures is out of scope of this International Standard.

Geographic information — Place Identifier (PI) architecture

1 Scope

This International Standard specifies an architecture that defines a reference model with an encoding method for an identifier of a place. The concept of “place” within this International Standard includes “places” not only in the real world but also those in the virtual world. These “places” are identified using either coordinate identifiers, geographic identifiers, or virtual world identifiers such as URI. In this International Standard, an identifier of a place is referred to as a Place Identifier (PI).

The reference model defines a mechanism to match multiple Place Identifiers to the same place. In addition, a data structure and set of service interfaces are also defined in this reference model.

This International Standard is applicable to location based services, emergency management services and other application domains that require a common architecture, across specific domains, for the representation of place descriptions using coordinate, geographic, or virtual world identifiers.

This International Standard is not about producing any kind of specific place description, nor about defining a unique, standardized description of defined places, such as an address coding scheme.

2 Conformance

2.1 Conformance clause

This International Standard specifies four conformance classes. The following conformance clauses should be followed in order to meet the requirements of this International Standard.

2.2 Conformance tests for Semantics

To conform to this International Standard, instances of PI_PlaceIdentifier, PI_ReferenceSystem, PI_MatchingTable, and PI_MatchedPISet shall satisfy the requirements of A.1.

2.3 Conformance tests for Data

To conform to this International Standard, data stored in the PI matching table and the reference system shall satisfy the requirements of A.2.

2.4 Conformance tests for Services

To conform to this International Standard, interfaces between services and users that the PI matching service and the reference system service implement shall satisfy the requirements of A.3.

2.5 Conformance tests for PI encoding

To conform to this International Standard, encoded instances of PI_PlaceIdentifier shall satisfy the requirements of A.4.

3 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

SS-ISO 19155:2012 (E)

ISO/TS 19103:2005, *Geographic Information — Conceptual schema language*

ISO 19111:2007, *Geographic information — Spatial referencing by coordinates*

ISO 19112:2003, *Geographic information — Spatial referencing by geographic identifiers*

ISO 19136:2007, *Geographic information — Geography Markup Language*

4 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

4.1 client

software component that can invoke an operation from a *server* (4.16)

[ISO 19128:2005, 4.1]

4.2 coordinate

one of a sequence of n numbers designating the position of a point in n -dimensional space

[ISO 19111:2007, 4.5]

NOTE In a *coordinate reference system* (4.4), the coordinate numbers are qualified by units.

4.3 coordinate operation

change of *coordinates* (4.2), based on a one-to-one relationship, from one *coordinate reference system* (4.4) to another

[ISO 19111:2007, 4.7]

NOTE Supertype of coordinate transformation and coordinate conversion.

4.4 coordinate reference system

coordinate (4.2) system that is related to an object by a datum

[ISO 19111:2007, 4.8]

NOTE For geodetic and vertical datums, the object will be the Earth.

4.5 gazetteer

directory of instances of a class or classes of features containing some information regarding position

[ISO 19112:2003, 4.2]

NOTE The positional information need not be *coordinates* (4.2), but could be descriptive.

4.6 geographic identifier

spatial reference (4.19) in the form of a label or code that identifies a location

[ISO 19112:2003, 4.3]

EXAMPLE 'Spain' is an example of a country name; 'SW1P 3AD' is an example of a postcode.

4.7

interface

named set of operations that characterize the behaviour of an entity

[ISO 19119:2005, 4.2]

4.8

place

identifiable part of any space

4.9

Place Identifier

PI

reference that identifies a *place* (4.8)

NOTE The same *place* may be referenced by multiple *Place Identifier* (4.9) instances. Each instance will be associated with a different reference system.

4.10

Place Identifier application

PI application

application providing *services* (4.17) that use *Place Identifiers* (4.9) to end *users* (4.21) or other applications

4.11

Place Identifier matching

PI matching

matching of a *Place Identifier* (4.9) specifying a *place* (4.8) with another type of PI identifying the same place

NOTE 1 A source PI can be matched with multiple target *Place Identifiers*.

NOTE 2 *PI matching* (4.11) can be made among *coordinates* (4.2), *geographic identifiers* (4.6) and identifiers in the virtual world such as URI.

4.12

Place Identifier platform

PI platform

group of *service* (4.17) *interfaces* (4.7) and data structures used for *PI matching* (4.11)

4.13

registration

assignment of a permanent, unique, and unambiguous identifier to an item

[ISO 19135:2005, 4.1.12]

4.14

request

invocation of an operation by a *client* (4.1)

[ISO 19128:2005, 4.10]

4.15

response

result of an operation returned from a *server* (4.16) to a *client* (4.1)

[ISO 19128:2005, 4.11]

4.16

server

particular instance of a *service* (4.17)

[ISO 19128:2005, 4.12]
